Memory sheet: Domain 1, FM integration and data

Exam weight 31 percent. Read this sheet, then answer the flash questions aloud.

Deciding rules

When the stem says	Think of	Not when
Lowest hosting work for foundation model calls	Amazon Bedrock	The team must own model weights or instance types
Inference must stay inside one geography	Geographic cross-Region profile	No residency rule applies, so a global profile can cut cost
Models or routes must change without a code deploy	Lambda router with AppConfig route data	Validation, staged rollout, and alarm rollback are not needed
Approved, rolled back, or retired model versions	SageMaker Model Registry with approval status	S3 versioning alone, which holds no approval state
Many tuned versions of one base model	LoRA adapters over one base	One tuned model with no version history to keep
Exact code, SKU, or rare name in a query	Hybrid search with keywords and vectors	The question depends only on meaning
Right passage retrieved but in the wrong order	Reranker model after retrieval	The right passage never reached the retrieved set
Prompt needs steps, branches, or waits	Prompt Flows or Step Functions	One prompt with one model call

Etch lines

1. Bedrock is managed, so you run no model servers and choose no instances.
2. Run a bounded PoC with written pass criteria before any full build.
3. A NAT route sends Bedrock calls out to the public internet.
4. State the constraint in one line before you open the answer options.
5. Converse suits one request shape across models that accept messages.
6. Model Registry holds approval status, so deploy only Approved versions.

Flash questions

- Q: Which managed service gives API access to foundation models without model servers to run? A: Amazon Bedrock.
- Q: Which cross-Region profile keeps inference inside a named geography such as the European Union? A: A geographic profile.
- Q: Why can a cross-Region inference profile not provide reserved capacity? A: Inference profiles do not support Provisioned Throughput.
- Q: What share of traffic does a canary release send to the new version first? A: A small share, so the new version proves itself first.
- Q: Which AWS feature changes application configuration without a code deployment and validates it first? A: AWS AppConfig.
- Q: What must be deployed with a LoRA adapter for it to run? A: Its base model.
- Q: Which endpoint name serves direct model calls such as Converse? A: bedrock-runtime.

- Q: How does a production app keep rollback to one value change? A: It calls a numbered version ARN that sits in configuration.
