Memory sheet: Task 5.1 Implement evaluation systems for GenAI

Domain 5, weight 11 percent. Read this sheet, then answer the flash questions aloud.

Deciding rules

When the stem says	Think of	Not when
An approved reference answer or summary exists	Automatic metric job with reference responses	A rubric or human opinion decides the quality
A rubric, a scale, or an explanation of the score is needed	Judge model job with a metric prompt	One exact correct string can be checked
Reviewers, preference, tone, or expert taste	Bedrock human evaluation job with a work team	A live answer needs review before delivery
Live sessions or a sampling rate on an agent	AgentCore online evaluation	A candidate must be approved before release
Before promotion or a release gate	Golden dataset run in the pipeline	Real users must see the change first
Passages, chunks, or search results	Retrieve-only test	The final answer must be checked for grounding
Block, deny, or mask	Guardrails at runtime	Quality or agent behavior must be scored

Etch lines

1. Name the object, timing, and evidence type first, then pick the service.
2. Fluency does not check facts, so a fluent answer can still be wrong.
3. Use a judge metric when no single correct string exists.
4. Online evaluation cannot approve a candidate before release on its own.
5. Guardrails act at runtime and do not score quality.
6. Underline the signal word before you read the options.

Flash questions

- Q: Which signal words point to a human work team job? A: Reviewers, preference, tone, or expert taste.
- Q: Which summary metric reflects word order through the longest common subsequence? A: ROUGE-L, because it uses that subsequence and so reflects order.
- Q: Which translation metric measures n-gram precision against human translations and penalizes short outputs? A: BLEU.
- Q: Does a high fluency score prove that the claims are true? A: No. Fluency only shows that the text reads well, so facts need a separate check.
- Q: Which AgentCore mode scores one chosen trace or span? A: On-demand evaluation.
- Q: If the golden set score falls below the agreed threshold, what happens to the deploy stage? A: The test stage fails, so the deploy stage does not run.
- Q: Does a retrieve-only job show whether the final answer is grounded? A: No. It stops before generation, so the answer is never scored.

- Q: Why is SageMaker Model Monitor a weak choice for judging wrong facts in answers? A: It compares data and model statistics with a baseline, not the meaning of the text.
